

DESCRIPTION

A4804 is a series of high precision voltage detector with ultra low current consumption (500nA typ. at $V_{DD} = 3.0V$). It can work at very low voltage, which makes it perfect for system reset.

A4804 is composed of high precision voltage reference, comparator, output driver and resistor array. Internally preset detect voltage has a low temperature drift and requires no external trimming.

N-channel open-drain is available.

A4804 is available in SOT-23 package.

DETAILED INFORMATION

In A4804, a high precision low temperature coefficient reference voltage is applied to the negative input of a comparator. Input voltage, divided by resistor array of Ra, Rb and Rc, is applied to the positive input of the comparator. Output of the comparator controls a pair of NMOS and PMOS switches, generating the hysteresis. Output of the comparator passes a series of buffer to drive the output NMOS.

OUTPUT ACTION

No.	Operation status	Output status
I	$V_{DD} > -V_{DET}$	Output voltage is equal to the supply voltage
II	V_{DD} drops below $-V_{DET}$	Output voltage equals to GND level
III	V_{DD} drops further below V_{DDL}	Output voltage is undefined
IV	V_{DD} rises above V_{DDL}	Output voltage equals to GND level
V	V_{DD} rises above $+V_{DET}$	Output voltage equals to supply voltage, $V_{HYS} = (+V_{DET}) - (-V_{DET})$
