

DESCRIPTION

A4809 is a series of high precision voltage detector with ultra-low current consumption (4.5uA typ. at $V_{IN}=3.0V$) and a built-in delay circuit. It can work at very low voltage, which makes it perfect for system reset.

A4809 is composed of high precision voltage reference, comparator, delay circuit, output driver and resistor array. Internally preset detect voltage has a low temperature drift and requires no external trimming.

Two type of output, CMOS and N-channel open-drain are available.

A4809 is available in SOT-23S package.

FUNCTION DESCRIPTION

High precision low temperature co-efficiency reference voltage is applied to the negative input of a comparator. Input voltage, divided by resistor array of Ra and Rb, is applied to the positive input of the comparator. Output of the comparator passes a delay circuit and a series of buffer to drive the output CMOS pair.

$$V_{DET} = V_{REF} * (1 + R_a/R_b)$$

No.	Operation status	Output status
I	$V_{DD} > V_{DET}$	Output voltage is equal to the supply voltage
II	V_{DD} drops below V_{DET}	Output voltage equals to GND level
III	V_{DD} drops further below V_{DDL}	Output voltage is undefined
IV	V_{DD} rises above V_{DDL}	Output voltage equals to GND level
V	V_{DD} rises above V_{DET}	Output voltage equals to supply voltage after t_{DELAY}
