

## DESCRIPTION

The A24C128 provides 131,072 bits of serial electrically erasable and programmable read-only memory (EEPROM), organized as 16,384 words of 8 bits each.

The A24C128 is optimized for use in many industrial and commercial applications where low-power and low-voltage operation are essential.

The A24C128 is access via a 2-wire serial interface from 1.7 to 5.5V.

The A24C128 is available SOP8, TSSOP8 DFN8, DIP8 and TSOT-25 packages.

## ORDERING INFORMATION

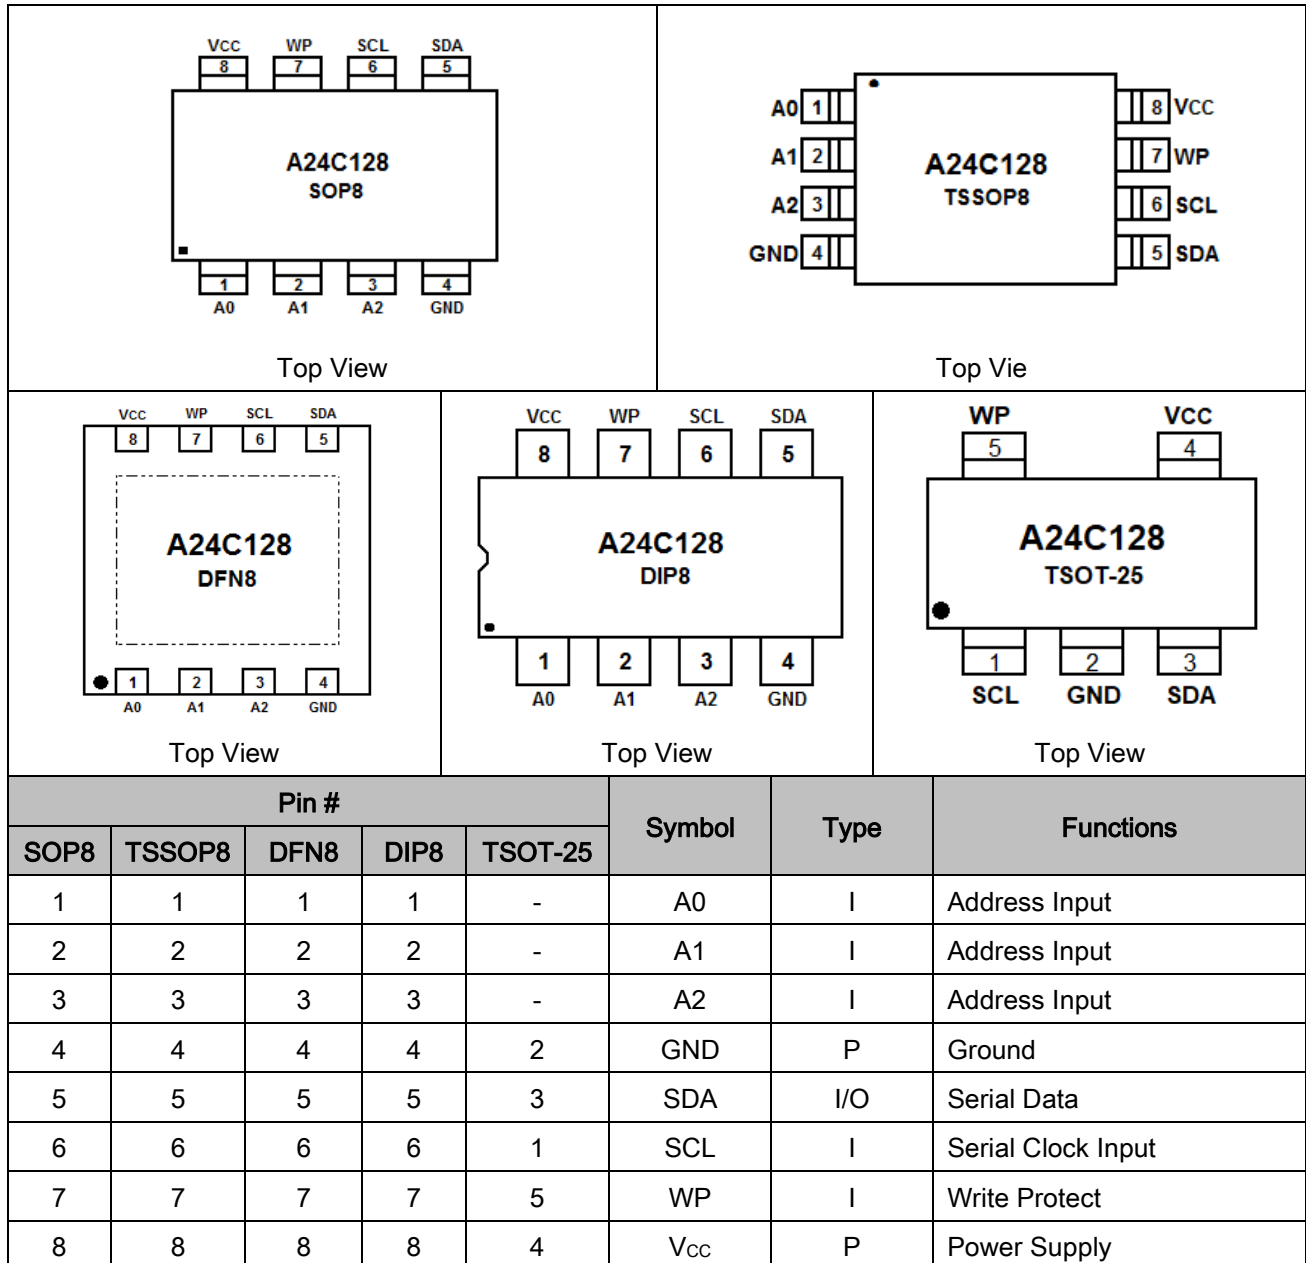

Package Type	Part Number	
SOP8 SPQ: 2,500pcs/Reel	M8	A24C128M8R-X
		A24C128M8U-X
		A24C128M8VR-X
		A24C128M8VU-X
TSSOP8 SPQ: 3,000pcs/Reel	TMX8	A24C128TMX8R-X
		A24C128TMX8U-X
		A24C128TMX8VR-X
		A24C128TMX8VU-X
DFN8 SPQ: 3,000pcs/Reel	J8	A24C128J8R-X
		A24C128J8VR-X
DIP8 SPQ: 50pcs/Tube	P8	A24C128P8U-X
		A24C128P8VU-X
TSOT-25 SPQ: 3,000pcs/Reel	TE5	A24C128TE5R-X
		A24C128TE5VR-X
Note	X: Temperature: A : -40°C to +85°C B : -40°C to +105°C C : -40°C to +125°C V: Halogen free Package R: Tape & Reel U: Tube	
AiT provides all RoHS products		

## FEATURES

- Compatible with all I<sup>2</sup>C bidirectional data transfer protocol :
  - 1 MHz
  - 400 kHz
  - 100 kHz
- Memory array:
  - 128k bits (16k bytes) of EEPROM
  - Page size: 64 bytes
  - Additional Write lockable page
- Extended Temperature Range
  - A : -40°C to +85°C
  - B : -40°C to +105°C
  - C : -40°C to +125°C
- Single supply voltage and high speed: 1 MHz
- Write:
  - Byte Write within 3 ms
  - Page Write within 3 ms
- Operating Ambient Temperature:
  - From -40°C up to +125°C
- High-reliability
  - Endurance: 1 Million Write Cycles
  - Data Retention: 100 Years
- Internal Organized 16,384 x 8 (128k bits)
- 2-Wire Serial Interface
- Schmitt Trigger, Filtered Inputs for Noise Suppression
- Bidirectional Data Transfer Protocol
- Partial Page Writes Allowed
- Write Protect Pin for Hardware Data Protection
- Self-timed Write Cycle (5 ms max)

## PIN DESCRIPTION

## ABSOLUTE MAXIMUM RATINGS

DC Supply Voltage	-0.3V ~ +6.5V
Input / Output Voltage	GND-0.3V ~ V <sub>CC</sub> +0.3V
Operating Ambient Temperature	-40°C to +125°C
Storage Temperature	-65°C ~ +150°C
Electrostatic Pulse (Human Body model)	8000V

Stress beyond above listed "Absolute Maximum Ratings" may lead permanent damage to the device. These are stress ratings only and operations of the device at these or any other conditions beyond those indicated in the operational sections of the specifications are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## PIN CAPACITANCE

Applicable over recommended operating range : T<sub>A</sub>=25°C, f=1.0MHz, V<sub>CC</sub>=+1.7V

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Input / Output Capacitance (SDA)	C <sub>I/O</sub>	V <sub>IO</sub> =0V	-	-	8	pF
Input Capacitance (A0, A1, A2, SCL)	C <sub>IN</sub>	V <sub>IN</sub> =0V	-	-	6	pF

## DC ELECTRICAL CHARACTERISTICS

Applicable over recommended operating range, unless otherwise noted

A24C128-A	T <sub>A</sub> = -40°C to +85°C	V <sub>CC</sub> = +1.7V to +5.5V
A24C128-B	T <sub>A</sub> = -40°C to +105°C	
A24C128-C	T <sub>A</sub> = -40°C to +125°C	

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
Supply Voltage	V <sub>CC1</sub>	@400kHz	1.7	-	5.5	V
Supply Voltage	V <sub>CC2</sub>	@1MHz	2.5	-	5.5	V
Supply Current V <sub>CC</sub> =5.0V	I <sub>CC1</sub>	Read at 400kHz	-	0.14	0.3	mA
Supply Current V <sub>CC</sub> =5.0V	I <sub>CC2</sub>	Write at 400kHz	-	0.28	0.5	mA
Supply Current V <sub>CC</sub> =5.0V	I <sub>SB1</sub>	V <sub>IN</sub> =V <sub>CC</sub> or V <sub>SS</sub>	-	0.40	5.0	μA
Input Leakage Current	I <sub>LI</sub>	V <sub>IN</sub> =V <sub>CC</sub> or V <sub>SS</sub>	-	0.10	1.0	μA
Output Leakage Current	I <sub>LO</sub>	V <sub>OUT</sub> = V <sub>CC</sub> or V <sub>SS</sub>	-	0.05	1.0	μA
Input Low Level	V <sub>IL1</sub>	V <sub>CC</sub> =1.7V to 5.5V	-0.3	-	V <sub>CC</sub> ×0.3	V
Input High Level	V <sub>IH1</sub>	V <sub>CC</sub> =1.7V to 5.5V	V <sub>CC</sub> ×0.7	-	V <sub>CC</sub> +0.3	V
Output Low Level V <sub>CC</sub> =1.7V	V <sub>OL1</sub>	I <sub>OL</sub> =0.15mA	-	-	0.2	V
Output Low Level V <sub>CC</sub> =5.0V	V <sub>OL2</sub>	I <sub>OL</sub> =3.0mA	-	-	0.4	V

## AC ELECTRICAL CHARACTERISTICS

Applicable over recommended operating range, unless otherwise noted

A24C128-A	T <sub>A</sub> = -40°C to +85°C	V <sub>CC</sub> = +1.7V to +5.5V C <sub>L</sub> = 1 TTL Gate and 100 pF
A24C128-B	T <sub>A</sub> = -40°C to +105°C	
A24C128-C	T <sub>A</sub> = -40°C to +125°C	

Parameter	Symbol	1.7V ≤ V <sub>CC</sub> < 2.5V			2.5V ≤ V <sub>CC</sub> < 5.5V			Unit
		Min.	Typ.	Max.	Min.	Typ.	Max.	
Clock Frequency, SCL	f <sub>SCL</sub>	-	-	400	-	-	1000	kHz
Clock Pulse Width Low	t <sub>LOW</sub>	1.3	-	-	0.5	-	-	μs
Clock Pulse Width High	t <sub>HIGH</sub>	0.6	-	-	0.26	-	-	μs
Noise Suppression Time	t <sub>i</sub>	-	-	50	-	-	50	ns
Clock Low to Data Out Valid	t <sub>AA</sub>	-	-	0.9	-	-	0.45	μs
Time the bus must be free before a new transmission can start	t <sub>BUF</sub>	1.3	-	-	0.5	-	-	μs
Start Hold Time	t <sub>HD.STA</sub>	0.6	-	-	0.25	-	-	μs
Start Setup Time	t <sub>SU.STA</sub>	0.6	-	-	0.25	-	-	μs
Data In Hold Time	t <sub>HD.DAT</sub>	0	-	-	0	-	-	μs
Data In Setup Time	t <sub>SU.DAT</sub>	100	-	-	100	-	-	ns
Input Rise Time <sup>NOTE1</sup>	t <sub>R</sub>	-	-	0.3	-	-	0.12	μs
Input Fall Time <sup>NOTE1</sup>	t <sub>F</sub>	-	-	0.3	-	-	0.12	μs
Stop Setup Time	t <sub>SU.STO</sub>	0.6	-	-	0.25	-	-	μs
Data Out Hold Time	t <sub>DH</sub>	50	-	-	50	-	-	ns
Write Cycle Time	t <sub>WR</sub>	-	1.9	3	-	1.9	3	ms
5.0V, 25°C, Byte Mode <sup>NOTE1</sup>	Endurance	1M	-	-	1M	-	-	Write Cycle

NOTE1: This parameter is characterized and is not 100% tested.

NOTE2: AC measurement conditions: R<sub>L</sub>(connects to V<sub>CC</sub>): 1.3k(2.5V,5V),10k(1.7V)

Input pulse voltages: 0.3V<sub>CC</sub> to 0.7V<sub>CC</sub>

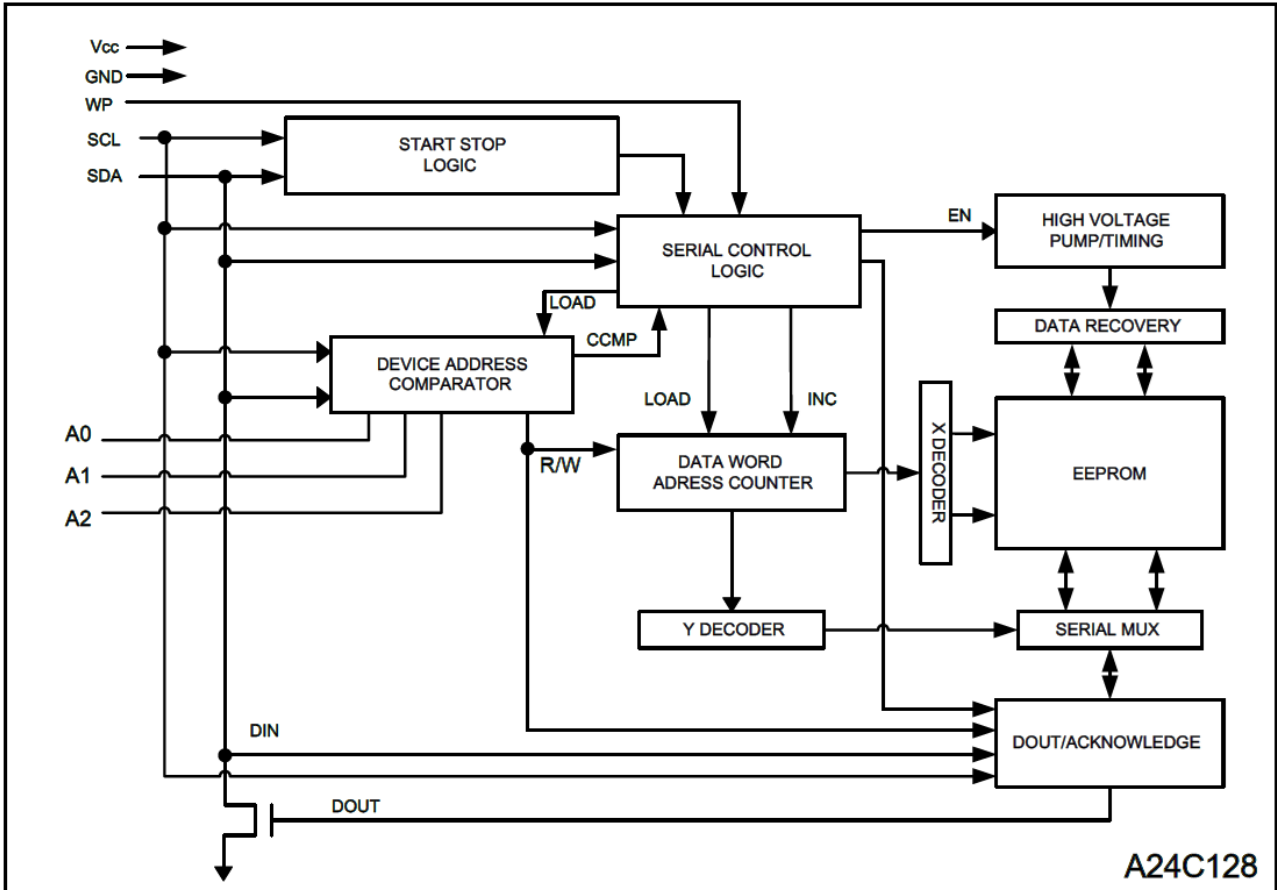

Input rise and fall time: 50ns

Input and output timing reference voltages: 0.5V<sub>CC</sub>

The value of R<sub>L</sub> should be concerned according to the actual loading on the user's system.

**BLOCK DIAGRAM**

## DETAILED INFORMATION

**DEVICE/PAGE ADDRESSES (A2, A1 and A0):** The A2, A1 and A0 pins are device address inputs that are hard wire for the A24C128. Eight 128k devices may be addressed on a single bus system (device addressing is discussed in detail under the Device Addressing section).

**SERIAL DATA (SDA):** The SDA pin is bi-directional for serial data transfer. This pin is open-drain driven and may be wire-ORed with any number of other open-drain or open- collector devices.

**SERIAL CLOCK (SCL):** The SCL input is used to positive edge clock data into each EEPROM device and negative edge clock data out of each device.

**WRITE PROTECT (WP):** The A24C128 has a Write Protect pin that provides hardware data protection. The Write Protect pin allows normal read/write operations when connected to ground (GND). When the Write Protection pin is connected to  $V_{CC}$ , the write protection feature is enabled and operates as shown in the following Table 1.

Table1. Write Protect

WP Pin Status	A24C128
At $V_{CC}$	Full (128k) Array
At GND	Normal Read/Write Operations

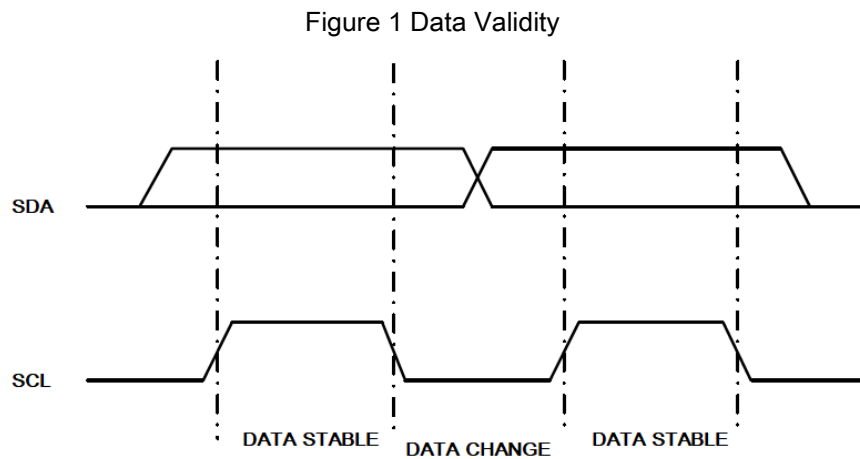

## FUNCTIONAL DESCRIPTION

### 1. Memory Organization

**A24C128, 128k SERIAL EEPROM:** Internally organized with 256 pages of 64 bytes each, the 128k requires a 14-bit data word address for random word addressing.

### 2. Device Operation

**CLOCK and DATA TRANSITIONS:** The SDA pin is normally pulled high with an external device. Data on the SDA pin may change only during SCL low time periods (see Figure 1). Data changes during SCL high periods will indicate a start or stop condition as defined below.

**START CONDITION:** A high-to-low transition of SDA with SCL high is a start condition which must precede any other command (see Figure 2).

**STOP CONDITION:** A low-to-high transition of SDA with SCL high is a stop condition. After a read sequence, the stop command will place the EEPROM in a standby power mode (see Figure 2)

Figure 2 Start and Stop Definition

**ACKNOWLEDGE:** All addresses and data words are serially transmitted to and from the EEPROM in 8-bit words. The EEPROM sends a “0” to acknowledge that it has received each word. This happens during the ninth clock cycle.

Figure 3 Output Acknowledge

**STANDBY MODE:** The A24C128 features a low-power standby mode which is enabled: (a) upon power-up and (b) after the receipt of the STOP bit and the completion of any internal operations.

**MEMORY RESET:** After an interruption in protocol, power loss or system reset, any two-wire part can be reset by following these steps:

1. Clock up to 9 cycles.
2. Look for SDA high in each cycle while SCL is high.
3. Create a start condition.

### 3. Device Addressing

The 128k EEPROM devices all require an 8-bit device address word following a start condition to enable the chip for a read or write operation (see Figure 4).

Figure 4 Device Address

The device address word consists of a mandatory “1”, “0” sequence for the first four most significant bits as shown. This is common to all the Serial EEPROM devices.

The 128k EEPROM uses A2, A1 and A0 device address bits to allow as much as eight devices on the same bus. These 3 bits must be compared to their corresponding hardwired input pins. The A2, A1 and A0 pins use an internal proprietary circuit that biases them to a logic low condition if the pins are allowed to float.

The eighth bit of the device address is the read/write operation select bit. A read operation is initiated if this bit is high and a write operation is initiated if this bit is low.

Upon a compare of the device address, the EEPROM will output a “0”. If a compare is not made, the chip will return to a standby state.

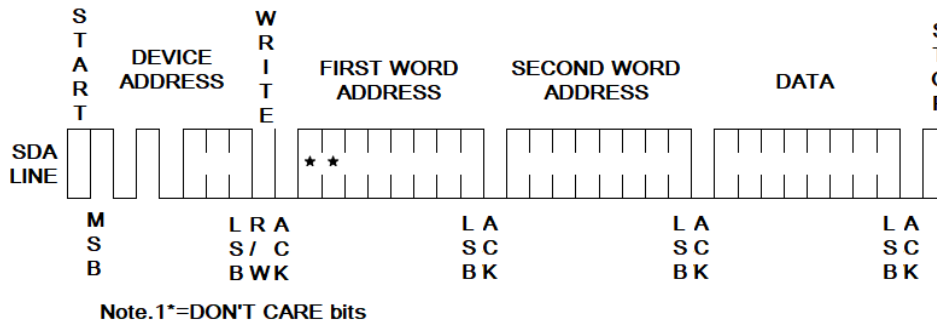

**DATA SECURITY:** The A24C128 has a hardware data protection scheme that allows the user to write protect the entire memory when the WP pin is at  $V_{CC}$ .

### 4. Write Operations

**BYTE WRITE:** A write operation requires two 8-bit data words address following the device address word and acknowledgment. Upon receipt of every 8-bit address, the EEPROM will respond with a “0” and then clock in the first 8-bit data word. Following receipt of the 8-bit data word, the EEPROM will output a “0” and the addressing device, such as a microcontroller, must terminate the write sequence with a stop condition. At this time the EEPROM enters an internally timed write cycle,  $t_{WR}$ , to the nonvolatile memory. All inputs are disabled during this write cycle and the EEPROM will not respond until the write is complete (see Figure 5).

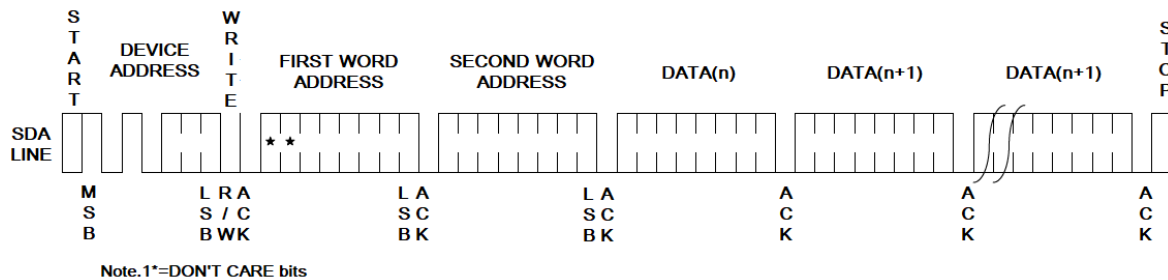

Figure 5 Byte Write

**PAGE WRITE:** The 128k EEPROM is capable of a 64-byte page writes. A page write is initiated the same as a byte write, but the microcontroller does not send a stop condition after the first data word is clocked in. Instead, after the EEPROM acknowledges receipt of the first data word, the microcontroller can transmit up to 63 more data words. The EEPROM will respond with a “0” after each data word received. The microcontroller must terminate the page write sequence with a stop condition (see Figure 6).

Figure 6 Page Write

The data word address lower six bits are internally incremented following the receipt of each data word. The higher data word address bits are not incremented, retaining the memory page row location. When the word address, internally generated, reaches the page boundary, the following byte is placed at the beginning of the same page. If more than 64 data words are transmitted to the EEPROM, the data word address will “roll over” and previous data will be overwritten.

**WRITE IDENTIFICATION PAGE:** The Identification Page (64bytes) is an additional page which can be written and (later) permanently locked in Read-only mode. It is written by issuing the Write Identification Page instruction. This instruction uses the same protocol and format as Page Write (into memory array), except for the following differences:

- Device type identifier = 1011b
- MSB address bits B15/B6 are don't care except for address bit B10 which must be "0".

LSB address bits B5/B0 define the byte address inside the Identification page.

If the Identification page is locked, the data bytes transferred during the Write Identification Page instruction are not acknowledged (NoAck).

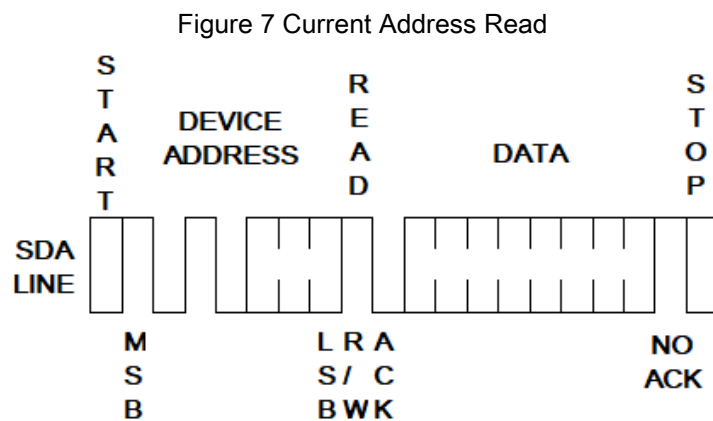

**ACKNOWLEDGE POLLING:** Once the internally timed write cycle has started and the EEPROM inputs are disabled, acknowledge polling can be initiated. This involves sending a start condition followed by the device address word. The read/write bit is representative of the operation desired. Only if the internal write cycle has completed will the EEPROM respond with a “0”, allowing the read or write sequence to continue.

### 5. Read Operations

Read operations are initiated the same way as write operations with the exception that the read/write select bit in the device address word is set to “1”. There are three read operations: current address read, random address read and sequential read.

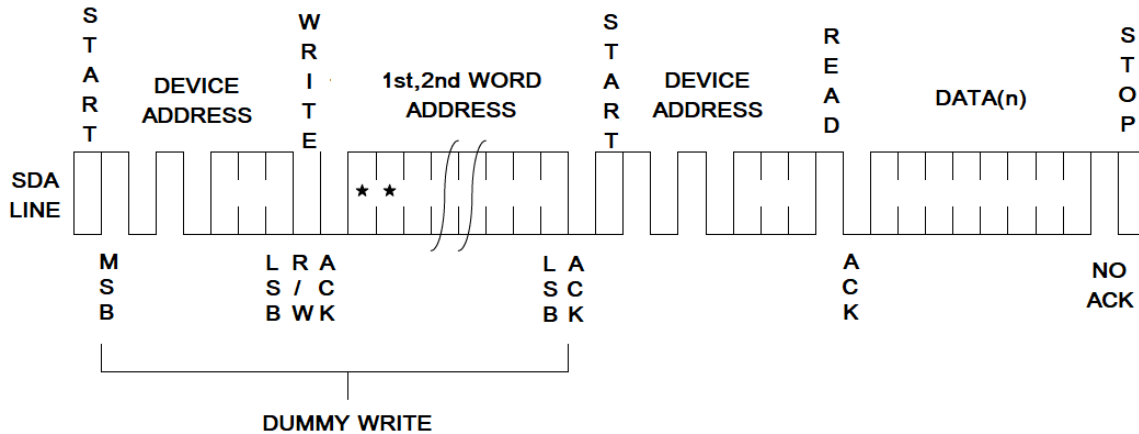

**CURRENT ADDRESS READ:** The internal data word address counter maintains the last address accessed during the last read or write operation, incremented by one. This address stays valid between operations as long as the chip power is maintained. The address “roll over” during read is from the last byte of the last memory page to the first byte of the first page. The address “roll over” during write is from the last byte of the current page to the first byte of the same page. Once the device address with the read/write select bit set to “1” is clocked in and acknowledged by the EEPROM, the current address data word is serially clocked out. The microcontroller does not respond with an input “0” but does generate a following stop condition (see Figure 7).

**RANDOM READ:** A random read requires a “dummy” byte write sequence to load in the data word address. Once the device address word and data word address are clocked in and acknowledged by the EEPROM, the microcontroller must generate another start condition. The microcontroller now initiates a current address read by sending a device address with the read/write select bit high. The EEPROM acknowledges the device address and serially clocks out the data word. The microcontroller does not respond with a “0” but does generate a following stop condition (see Figure 8).

Figure 8 Random Read

Note. 1\* = DON'T CARE bits

**SEQUENTIAL READ:** Sequential reads are initiated by either a current address read or a random address read. After the microcontroller receives a data word, it responds with an acknowledge. As long as the EEPROM receives an acknowledge, it will continue to increment the data word address and serially clock out sequential data words. When the memory address limit is reached, the data word address will “roll over” and the sequential read will continue. The sequential read operation is terminated when the microcontroller does not respond with a “0” but does generate a following stop condition (see Figure 9)

Figure 9 Sequential Read

**READ IDENTIFICATION PAGE:** The Identification Page (64 bytes) is an additional page which can be written and (later) permanently locked in Read-only mode.

The Identification Page can be read by issuing a Read Identification Page instruction. This instruction uses the same protocol and format as the Random Address Read (from memory array) with device type identifier defined as 1011b. The MSB address bits B15/B6 are don't care, the LSB address bits B5/B0 define the byte address inside the Identification Page. The number of bytes to read in the ID page must not exceed the page boundary (e.g.: when reading the Identification Page from location 10d, the number of bytes should be less than or equal to 54, as the ID page boundary is 64 bytes)

**LOCK IDENTIFICATION PAGE:** The Lock Identification Page instruction (Lock ID) permanently locks the Identification page in Read-only mode. The Lock ID instruction is similar to Byte Write (into memory array) with the following specific conditions:

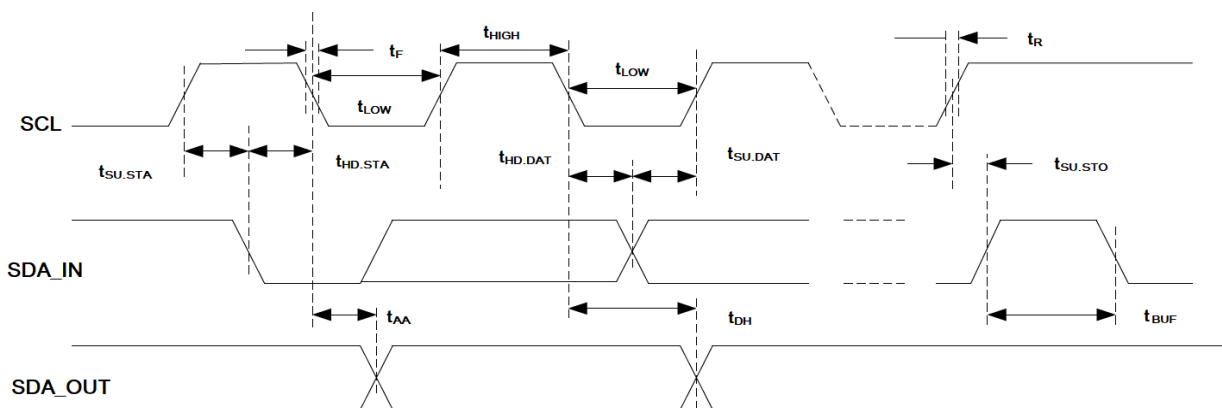

Device type identifier = 1011b

Address bit B10 must be '1'; all other address bits are don't care

The data byte must be equal to the binary value xxxx xx1x, where x is don't care

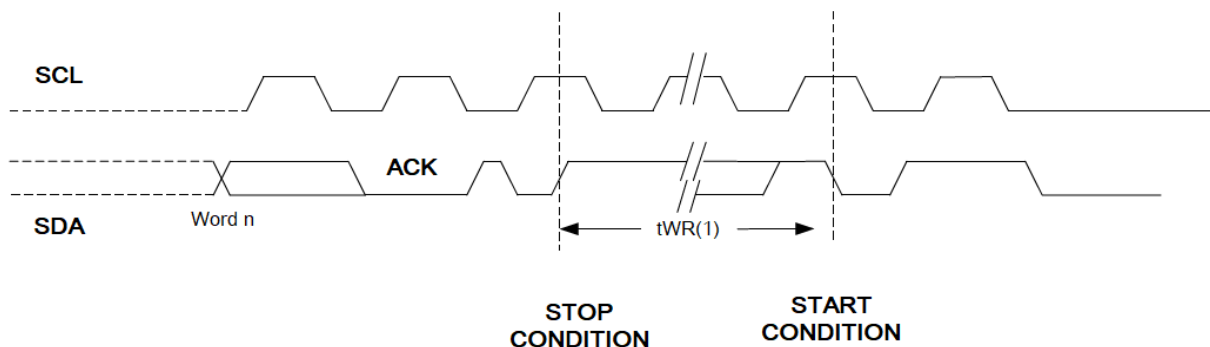

### BUS TIMING

Figure 10 SCL: Serial Clock, SDA: Serial Data I/O

### WRITE CYCLE TIMING

Figure 11 SCL: Serial Clock, SDA: Serial Data I/O

NOTE: The write cycle time  $t_{WR}$  is the time from a valid stop condition of a write sequence to the end of the internal clear/write cycle.
